Propagation is the process whereby the energy moves from one region of space to an adjacent region, and wave is a general term for a moving spatial distribution of energy. The matter in the region of space through which the propagation occurs is called the transmission medium. A random or stochastic medium is a family of media together with a probability distribution which specifies the probabilities of the various members of the family. Thus wave propagation in a random medium refers to propagation in each member of the family of media, together with the probability of each member. This probability, when associated with the wave motion in each medium, characterizes a random wave motion. Mathematically a wave motion is described by a vector-valued function $u(x, t)$ of the position vector x and the time t . As a consequence of the physical laws governing the wave motion, the function $u(x, t)$ satisfies certain equations. Usually they are partial differential equations...
